- I. We were flying to close a formation to begin with. As I remember we were in a turn to the left, when I noticed the lead ship seemed to be coming up and out faster than I had at first judged it to be. I began to try and slide out when I happened to glance up and saw another ship directly overhead. My right wing was coming up fast and I nearly saw the ship above to late. There was only one thing to do and that was try to slide out flat, which the co-pilot and I tried to do by applying full left rudder. We were not quick enough which resulted in the mid air accident.
 - 2. Our position from above would look like this.

l. I was at the moment taking my oxygen mask off when I glanced out and noticed that our wing tip seemed to overlap the lead ship's wing tip. I motioned to the pilot to pull away, but at the same time the two ships seemed to clide towards each other, I think at the time that the lead ship was in a bank to the right. Above us was a ship from the high element, so that the only way the pilot could get out from the lead was to the left. Our propeller struck the surface of the lead ship resulting in intense vibration of our number four engine, which I proceeded to feather, while we aborted from the formation and returned to the home field.
